

Local Hosting in the Middle East

Jim Cowie

@jimcowie

Today's Presentation

- Let's examine local and remote hosting in Turkey, Iran, Saudi Arabia, the UAE, and Egypt.
 - The bigger picture: how does the Middle East stack up against its neighbors and the rest of the world, in terms of local hosting?
 - How might that impact network operators and the national economies they support?
-

Dyn supplied the underlying datasets for this research, as part of their support for understanding Internet evolution and the assessment of Internet performance in emerging markets.

Follow them:

<http://research.dyn.com>

 @dynresearch

To identify current trends in ccTLD zone hosting, we:

- **Reconstructed** country-level zonefiles via passive DNS, counting popular domains queried
- **Abstracted** FQDNs to sets of second- and third-level zones (\$something.cc, \$something.com.cc)
- **Geolocated** the A records returned for those zones and counted the fraction that were in various countries

Methodology (2)

The use of passive DNS for zone analysis samples each ccTLD in a way that biases towards domains that are **live** and **of interest to consumers**.

- We performed this analysis for 234 ccTLDs worldwide, from AD, AE, AF, AG, ... to YE, YT, ZA, ZM, ZW.
- Today we'll examine a few in greater detail:
IR, TR, SA, AE, and EG.

Is it just economics?

Internet Economies

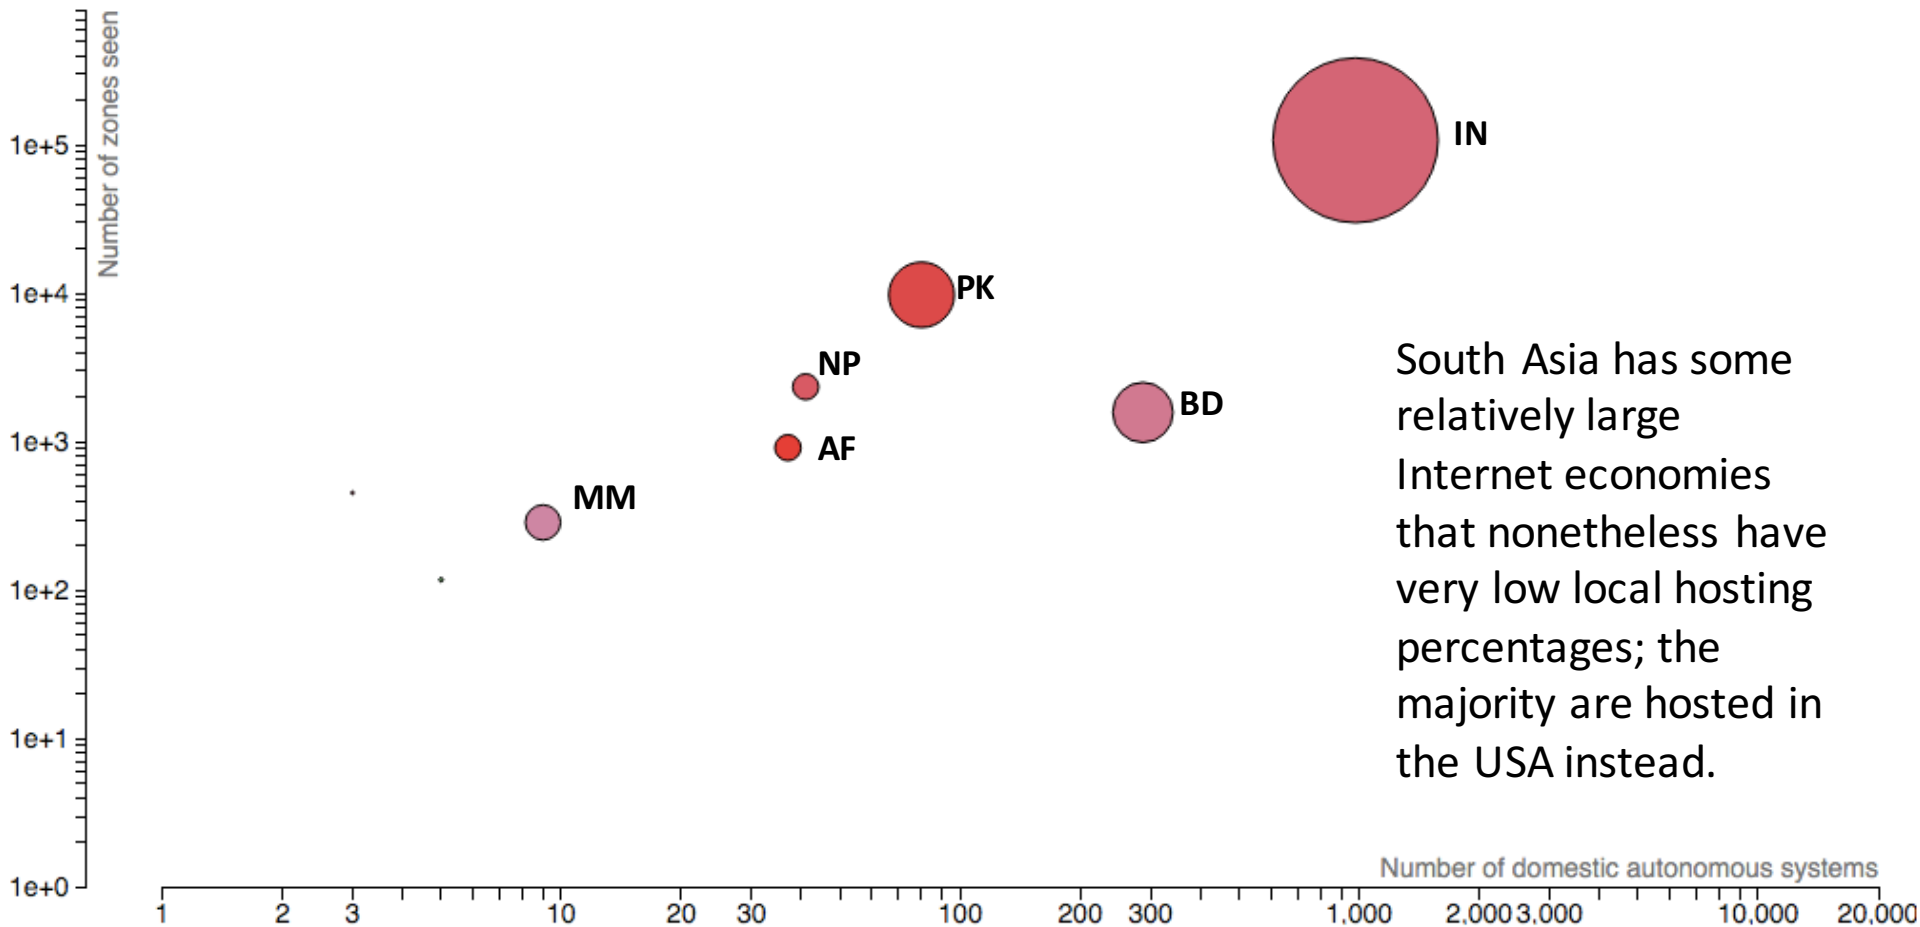

Self Hosting

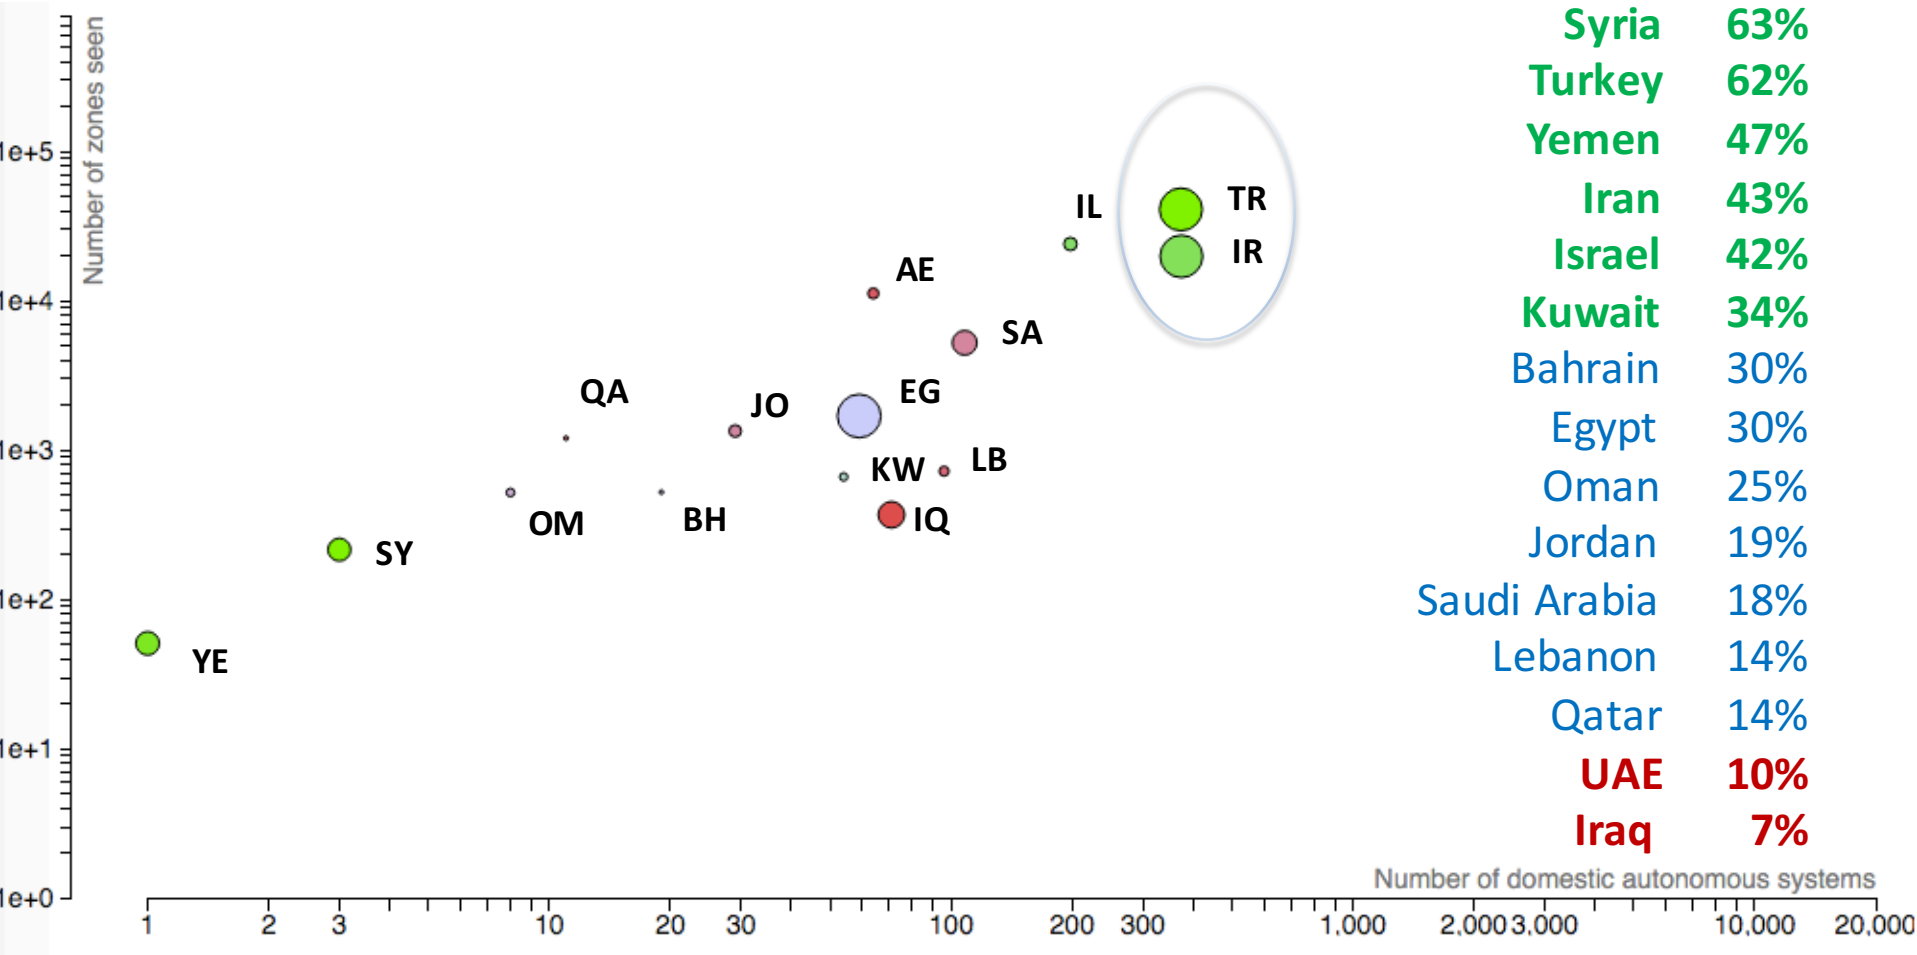

African Local Hosting

South Asia has some relatively large Internet economies that nonetheless have very low local hosting percentages; the majority are hosted in the USA instead.

Middle East Local Hosting

Where else do we turn?

Syria	63%	US 14%	DE 6%		CA 6%
Turkey	62%	US 16%	DE 5%		NL 5%
Yemen	47%	US 51%			
Iran	43%	US 17%	DE 19%	GB 7%	
Israel	42%	US 34%	DE 5%	GB 6%	
Kuwait	34%	US 45%		GB 5%	
Bahrain	30%	US 51%		GB 6%	
Egypt	30%	US 47%	DE 8%		
Oman	25%	US 52%		GB 5%	
Jordan	19%	US 58%	DE 9%		
S Arabia	18%	US 60%	DE 5%		
Lebanon	14%	US 66%		GB 6%	
Qatar	14%	US 55%		GB 6%	
UAE	10%	US 56%	DE 6%	GB 7%	
Iraq	7%	US 62%	DE 5%	GB 5%	SG 5%

Turkey, Iran, and Syria have relatively low dependence on the US for content hosting within their own ccTLD zones.

COM.\$CC usually has the least self hosting, followed by ORG, EDU or AC, and finally (understandably) GOV.

Examples:

- IR (43%): CO 43%, ORG 65%, AC 69%, GOV.IR 75%
- SA (18%): COM 13%, ORG 27%, EDU 33%, GOV.SA 53%
- EG (30%): COM 18%, ORG 42%, EDU 53%, GOV.EG 75%
- AE (11%): CO 40%, ORG 55%, AC 44%, GOV.AE 81%

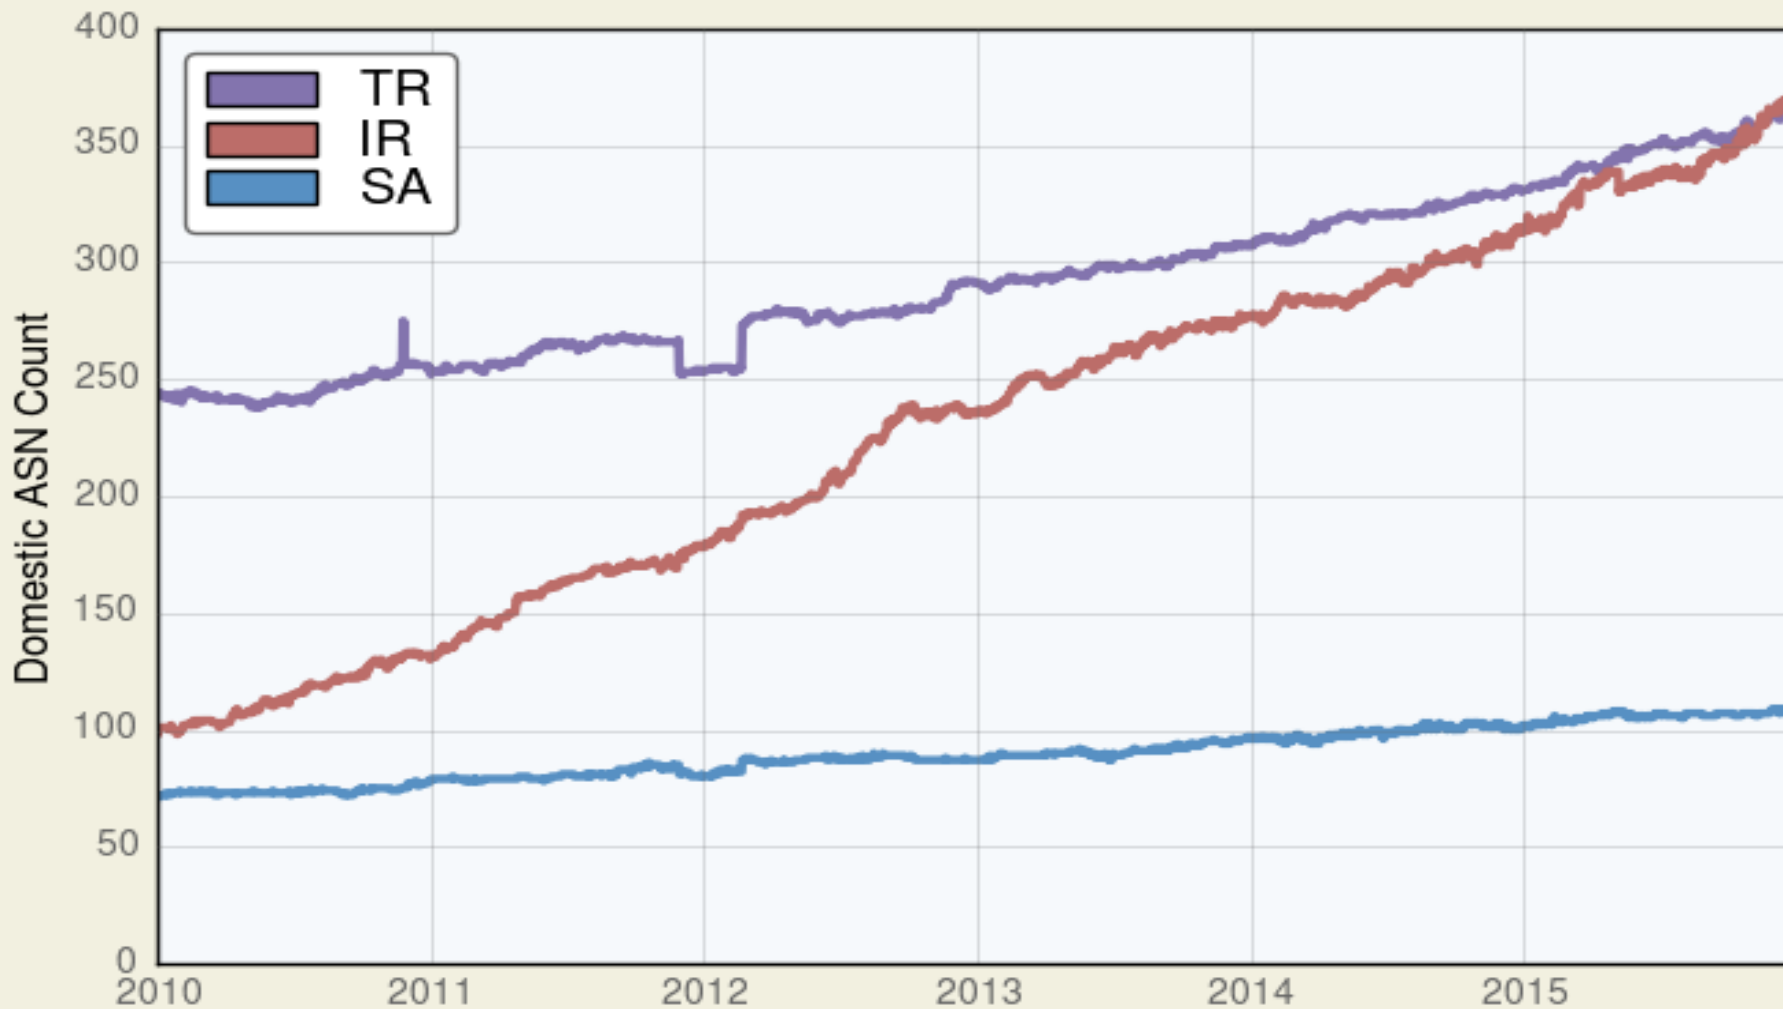

And...

- TR (62%): CO 62%, ORG 66%, EDU **91%**, GOV.TR 75%

The Big Picture

Growth of Internet in Iran, Turkey, and Saudi Arabia

Operators: So What?

Lack of local hosting creates:

- **Higher latency** (customer experience)

Latency (RTT)

*Domestic in **bold**

Local hosting depends on several factors:

- Size of the ‘real’ economy (GDP [per capita])
 - Size of the Internet economy (ASNs, Domains)
 - Political environment, content regulation
 - Proximity of other significant hosting countries (Germany in Europe, USA in North America, Singapore in Southeast Asia)
-

The Middle East has no natural centers of gravity for cross-border content hosting – **yet**.

- High per-capita GDP in the GCC has not yet translated into significant rates of local hosting
- UAE may anticipate more local hosting in 2016?
- Turkey and Iran are positioned to be the regional leaders for self-hosting of their domestic content
- The remaining factors for cross-border success are (as always) non-technical.

Local Hosting in the Middle East
